ance Notes on Codes and Abbreviations" appearing at the begin-
ning of each regular issue of the PCT Gazette.

(54) Title: ENTRY SYSTEM

(57) Abstract: The invention relates to an entry system which includes a base station (1) and at least one auxiliary station (2), the base station (1) transmitting a request bit sequence which is modulated on an RF carrier and comprises n data words of at least one bit each to the auxiliary station (2) in order to grant entry to the auxiliary station (2), which auxiliary station retransmits a response bit sequence which is modulated on an RF carrier and comprises m data words of at least one bit each to the base station (1), the base station (1) comparing the response time between the transmission of at least a few data words of the request bit sequence and the reception of the respective associated data words of the response bit sequence with a permissible response time, the auxiliary station (2) being granted entry only if the permissible response time for the tested data words of a response has been exceeded a number of times which is smaller than the value imposed by a maximum error count.
